

SHARED CARE AGREEMENT

Name of medicine Lisdexamfetamine and Dexamfetamine

Indication Attention deficit hyperactivity disorder (ADHD) in adults and children 6 years and older

Version: **4.0**

Approval date: **December 2024**

Review date: **December 2027**

The Shared Care Agreement (SCA) is intended to facilitate the accessibility and safe prescribing of complex treatments across the secondary/primary care interface. It does not contain all of the relevant product information, which should be sought using the current British National Formulary and manufacturer's Summary of Product Characteristics. The SCA must be used in conjunction with the NHS Lothian Procedure for the Shared Care of Medicines, available [here](#).

Roles and responsibilities

Listed below are specific responsibilities that are additional to those included in the NHS Lothian Policy and Procedures for Shared Care. Please refer to the policy for core roles and responsibilities that apply to all Shared Care Agreements.

Specialist Clinician

- Co-ordinate the assessment and diagnosis of ADHD in all patients. This may include:
 - Verification of ADHD diagnosis of patients from overseas; these patients should provide suitable correspondence from the previous medical providers.
 - Review of appropriate documentation which should also be provided for patients diagnosed privately or in another Health Board.
 - In some cases, it may be necessary for mental health services to repeat assessments.
- Initiate and optimise treatment including, supply and monitoring of lisdexamfetamine or dexamfetamine until patient's treatment is stable and for one further month.
- Informing patient of the 'off label' use of dexamfetamine where appropriate.
- Patient monitoring (see also 'Monitoring' below)
 - Children – height, weight, pulse, BP at baseline, 3 monthly, then 6 monthly in the longer term. All monitoring will be undertaken by CAMHS.
 - Adults – height, weight and family history of cardiovascular disease at baseline including referral for ECG if required, monitoring of BP and pulse during dose titration with 6 monthly monitoring shared with GP thereafter.
 - Re-evaluation of efficacy, tolerance, physical observations, and ongoing need for lisdexamfetamine or dexamfetamine treatment at least yearly.
- If lisdexamfetamine or dexamfetamine is continued beyond 18 years of age, the responsible CAMHS specialist clinician will arrange for care to be transferred to Adult Mental Health Services as appropriate.

General Practitioners and primary care non-medical prescribers

- GP to prescribe in accordance with the NHS Lothian Procedures for the Shared Care of Medicines
- For adults: Monitoring of weight, pulse, and blood pressure annually, ideally 6 months between secondary care annual reviews.
- Discontinuation: If patients wish to discontinue lisdexamfetamine or dexamfetamine, be aware that these may be stopped suddenly however, at higher doses it is possible that withdrawal effects might be seen. This may include extreme tiredness, rebound hyperactivity, increased appetite, and depression. If this occurs, re-start lisdexamfetamine or dexamfetamine and reduce gradually over several weeks. For further information see information for [adults](#) or [parents/carers](#).

Patient, relatives, carers

- As listed in NHS Lothian Procedures for the Shared Care of Medicines

Clinical Pharmacy Service West Lothian: 01506 522100

Key Information on the Medicine

Refer to current edition of the British National Formulary (BNF), available at www.bnf.org, and Summary of Product Characteristics (SPC), available at www.medicines.org.uk for detailed product and prescribing information and specific guidance. Local formulary guidance may be found on the [East Region Formulary \(ERF\)](#)

Background to disease and use of drug for the given indication

Attention deficit hyperactivity disorder (ADHD) is diagnosed if the three clinical features - inattention, overactivity and impulsiveness which have been present from an early age, persist in more than one situation (e.g., at home and in school) and impair function.

In children, the diagnosis must be made following a comprehensive assessment and formulation by an appropriate child and adolescent psychiatrist and/or specialist clinician with training in this field. A diagnosis in adults must be made following a comprehensive assessment by a psychiatrist.

The assessment and management of this condition has been reviewed [NICE Clinical Guideline \(NG 87\), September 2019](#). NICE recognises drug treatment of ADHD as part of a comprehensive treatment programme addressing psychological, behavioural and educational or occupational needs.

Patients are transferred from Child and Adolescent Mental Health Services (CAMHS) to adult mental health services at the age of 18 years if ongoing medication review is required.

Indication

Lisdexamfetamine is indicated for the treatment of ADHD as part of a comprehensive treatment programme in children aged 6 years and over when response to previous methylphenidate treatment is considered clinically inadequate.

Lisdexamfetamine is also indicated as part of a comprehensive treatment programme for ADHD in adults with pre-existing symptoms in childhood.

For adults, treatment must be initiated under the supervision of a psychiatrist, and for children, a specialist clinician with training in this field.

Dexamfetamine is indicated in children diagnosed with ADHD. It is not included in the East Region Formulary (ERF) for adults; therefore its use in adults is off-label.

Dosage and administration

Refer to current Summary of Product Characteristics (SPC): www.medicines.org.uk and prescribing notes in East Region Formulary ([ERF](#))

Monitoring in adults

Weight, pulse, and blood pressure should be monitored by the GP every six months (between specialist annual reviews).

If patients are experiencing a significant reduction in appetite and unintended weight loss as a result this should be discussed with the specialist team.

If a patient is found to have raised blood pressure (>140/90mmHg) in clinic, hypertension should be confirmed or excluded using ambulatory blood pressure monitoring or home blood pressure monitoring as per the [NHS Lothian Hypertension Guidelines](#). If a patient has confirmed Stage 1 or Stage 2 hypertension, methylphenidate should be stopped and observations repeated. The results should be discussed with the specialist team as to whether to continue treatment or not, and hypertension treated as per local guidance if appropriate. If a patient is found to have severe hypertension (systolic BP >180 mmHg or diastolic BP >120 mmHg), methylphenidate should be stopped immediately, and the specialist team informed.

Monitoring in children and adolescents under 18 years

For children, all monitoring will be carried out by the specialist CAMHS teams.

- Monitoring will be carried out at initiation, 3 monthly, then at a minimum of 6 monthly in the longer term.
- Monitoring will include measurement and plotting of height, weight, pulse and blood pressure centiles.
- Any findings that are out with the expected range for age will be investigated further including more frequent monitoring and if necessary, referral to another specialist.

Cautions, contraindications - Refer to current Summary of Product Characteristics: www.medicines.org.uk

Fertility, Pregnancy and Lactation - Refer to current Summary of Product Characteristics: www.medicines.org.uk for full details.

Adverse effects - Refer to current Summary of Product Characteristics: www.medicines.org.uk for full detail.

Drug interactions - Refer to current Summary of Product Characteristics: www.medicines.org.uk for full detail.

The presence of this SCA does not compel a primary care prescriber to prescribe if they feel that it is out with the scope of their competencies (as per GMC guidance on safe prescribing) or resources, as ultimate responsibility lies with the prescribing, not the recommending, clinician.

For office use only:

Approved by the General Practice Prescribing Committee (GPPC) on 23.06.2025
